MLHQC0	11.47 b
C0	8.77 c

Values followed by same letter are not significantly different at $P \leq 0.10$. HS3+ & HS1+, high shoot biomass markers present. LS2+=low shoot, HR2+=high root, and LR2+=low root biomass markers present

CONCLUSIONS 1st generation MAS populations

Drought stressed conditions (50% Malone background)

Yield among Cycle1 populations differed by 36%

Selection FOR high shoot and high root biomass markers improved alfalfa yield by 16 to 19%.

Selection AGAINST low shoot and low root biomass markers improved alfalfa yield by 1 to 15%.

Well-watered conditions (50% Malone background)

Yield among Cycle 1 populations differed by 11%

Selection for HS3+ high shoot biomass markers improved yield by 10% while other markers showed limited impact (0 to 3%).

CONCLUSIONS 2nd generation MAS populations

Drought stressed conditions (75% elite background)

Yield ranges: Melton hybrids (19%), Malone hybrids (27%),
MLHQ hybrids (20%)

2% yield loss of MeltonHS1+ hybrid (best) vs Melton

3% yield gain of MaloneHS3+ hybrid (best) vs Malone

14% yield gain of MLHQLS2+ hybrid (best) vs MLHQ

Well-watered conditions (75% elite background)

Yield ranges: Melton hybrids (15%), Malone hybrids (13%),
MLHQ hybrids (15%).

6% yield gain of MeltonHS1+ hybrid (best) vs Melton

5% yield gain of MaloneHS3+ hybrid (best) vs Malone

4% yield gain of MLHQLS2+ hybrid (best) vs MLHQ

GENERAL CONCLUSIONS

DNA marker assisted breeding has good potential to improve alfalfa productivity in drought-prone and well-watered environments.

Greatest improvements were observed in the most drought sensitive germplasm.
