# Introduction

Coastal Plains

# Introduction

## Bermudagrass

<https://hayandforage.com/article-101-top-reasons-for-bermudagrass-decline.html>

## Bahiagrass

<https://www.aces.edu/blog/topics/forages-livestock/bahiagrass-management/>

# Which management is best?

**Grazing**

**Baleage**

# Objective

To compare three harvest strategies of alfalfa interseeded into Tifton-85 bermudagrass in terms of animal and forage responses

# Study Establishment

**Study location:** Headland, Alabama and Tifton, GA

Year 1: June – November 2020

Year 2: April – December 2021

**Established '*Bulldog 805*' alfalfa into '*Tifton-85*' bermudagrass**

Planting Rate: 16.8 kg ha<sup>-1</sup>

Row spacing: 35.5 cm

Planting Depth: 1.27 cm

# Experimental Design

Randomized Complete Block Design

## Harvest Treatments

- Cut Only
- Graze Only
- Cut and Graze (CG)

# Study Design

## Graze

Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
-----	-----	-----	-----	-----	-----	-----	-----	-----

## Cut

Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
-----	-----	-----	-----	-----	-----	-----	-----	-----

## CG

Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
-----	-----	-----	-----	-----	-----	-----	-----	-----

# Baleage Management

Harvested paddocks on 28-35d interval

Baled at a target moisture of ~55%

Alfalfa 1<sup>st</sup> harvest in Y1 was at 25 % bloom, all subsequent harvests for Y1 and all Y2 10 % bloom

# Grazing and Animal Management

## In-Season Grazing

- Paddocks divided into four subsections
- Put-and-take grazing

## Stockpile Grazing

- Fixed stocking with size of subsection changing
- Graze for 3% BW, 75% efficiency of utilization

Sec 4

Sec 3

# Forage Collection and Analysis

- Forage collected from 0.1 m<sup>2</sup> quadrats
- Evaluated for:
  - Herbage availability
  - Botanical composition
  - Nutritive value (NIR analysis)

# Statistical Analysis

- Statistical analysis was conducted using the PROC MIXED procedure of SAS 9.4 (Cary, NC)
- Fixed Effects = Year, Location, and Harvest Method
- Random Effects = Block
- Ran with REPEATED measures
- Significance defined at  $\alpha \leq 0.05$

# Results: Weather

## Headland, AL

### Avg. Max Temperature

- Year 1: 28.3 °C
- Year 2: 27.4 °C

### Avg. Rainfall

- Year 1: 104.1 mm
- Year 2: 114.3 mm

## Tifton, GA

### Avg. Max Temperature

- Year 1: 25.6 °C
- Year 2: 25.1 °C

### Avg. Rainfall

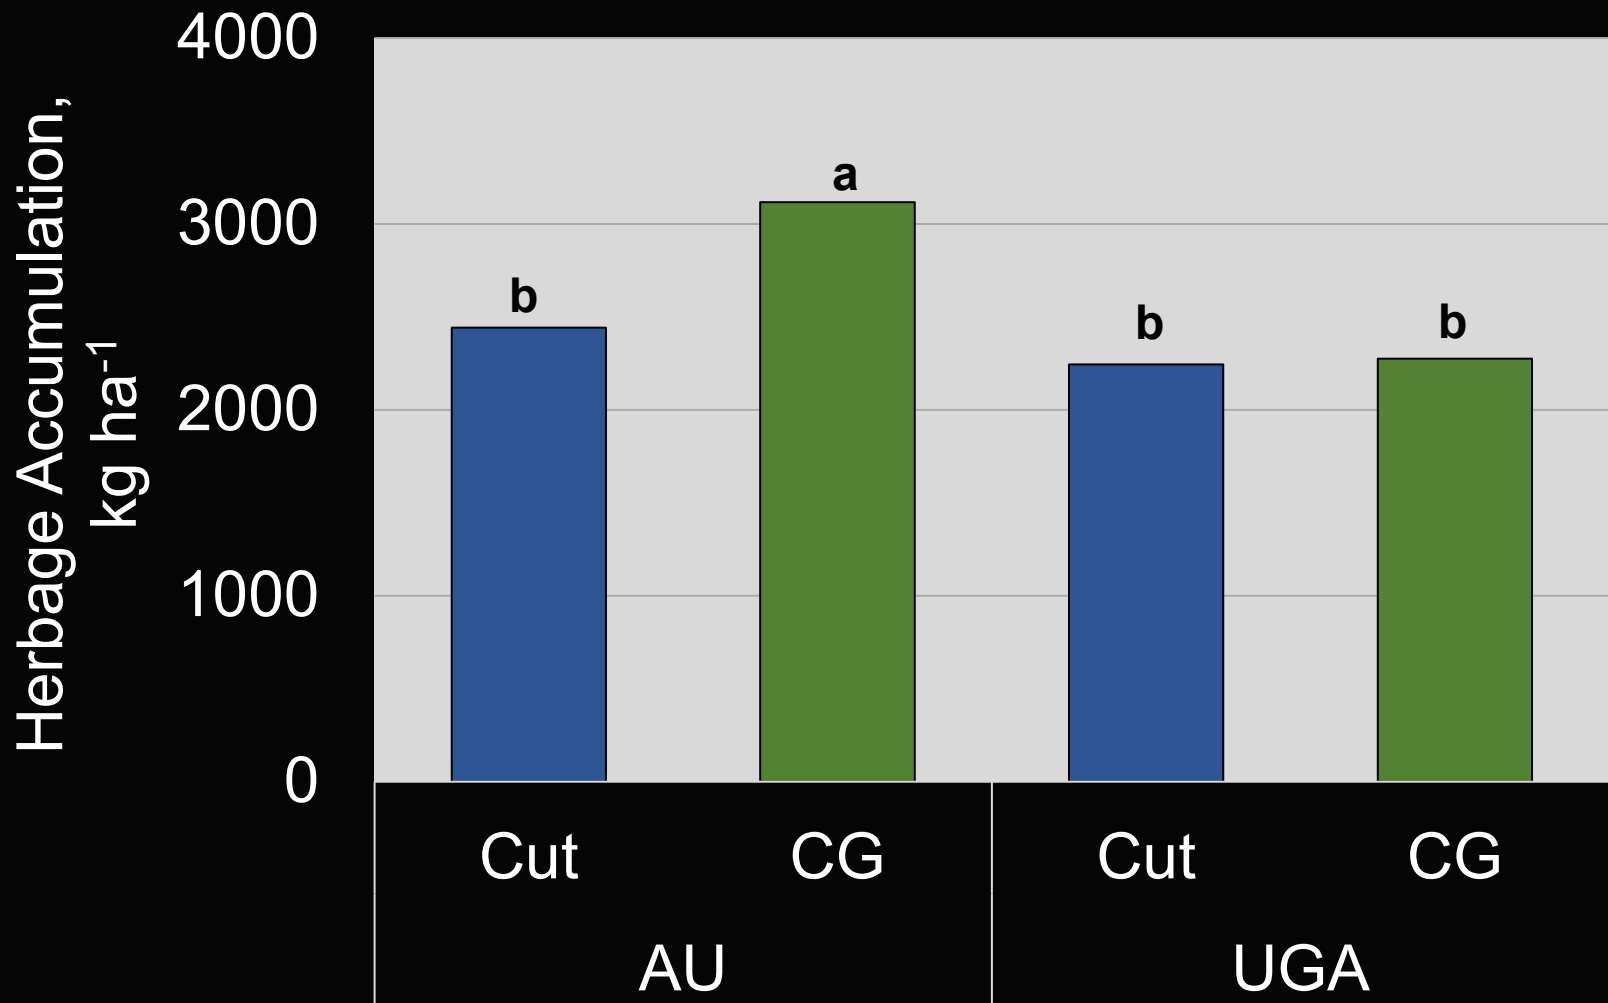

- Year 1: 103.2 mm
- Year 2: 131.5 mm

# Results: Baleage Data

# Results: Herbage Accumulation

## Results: Grazing Data

# Results: Grazing Days

Year 1		
	CG	Graze
Auburn	56	98
UGA	84	112

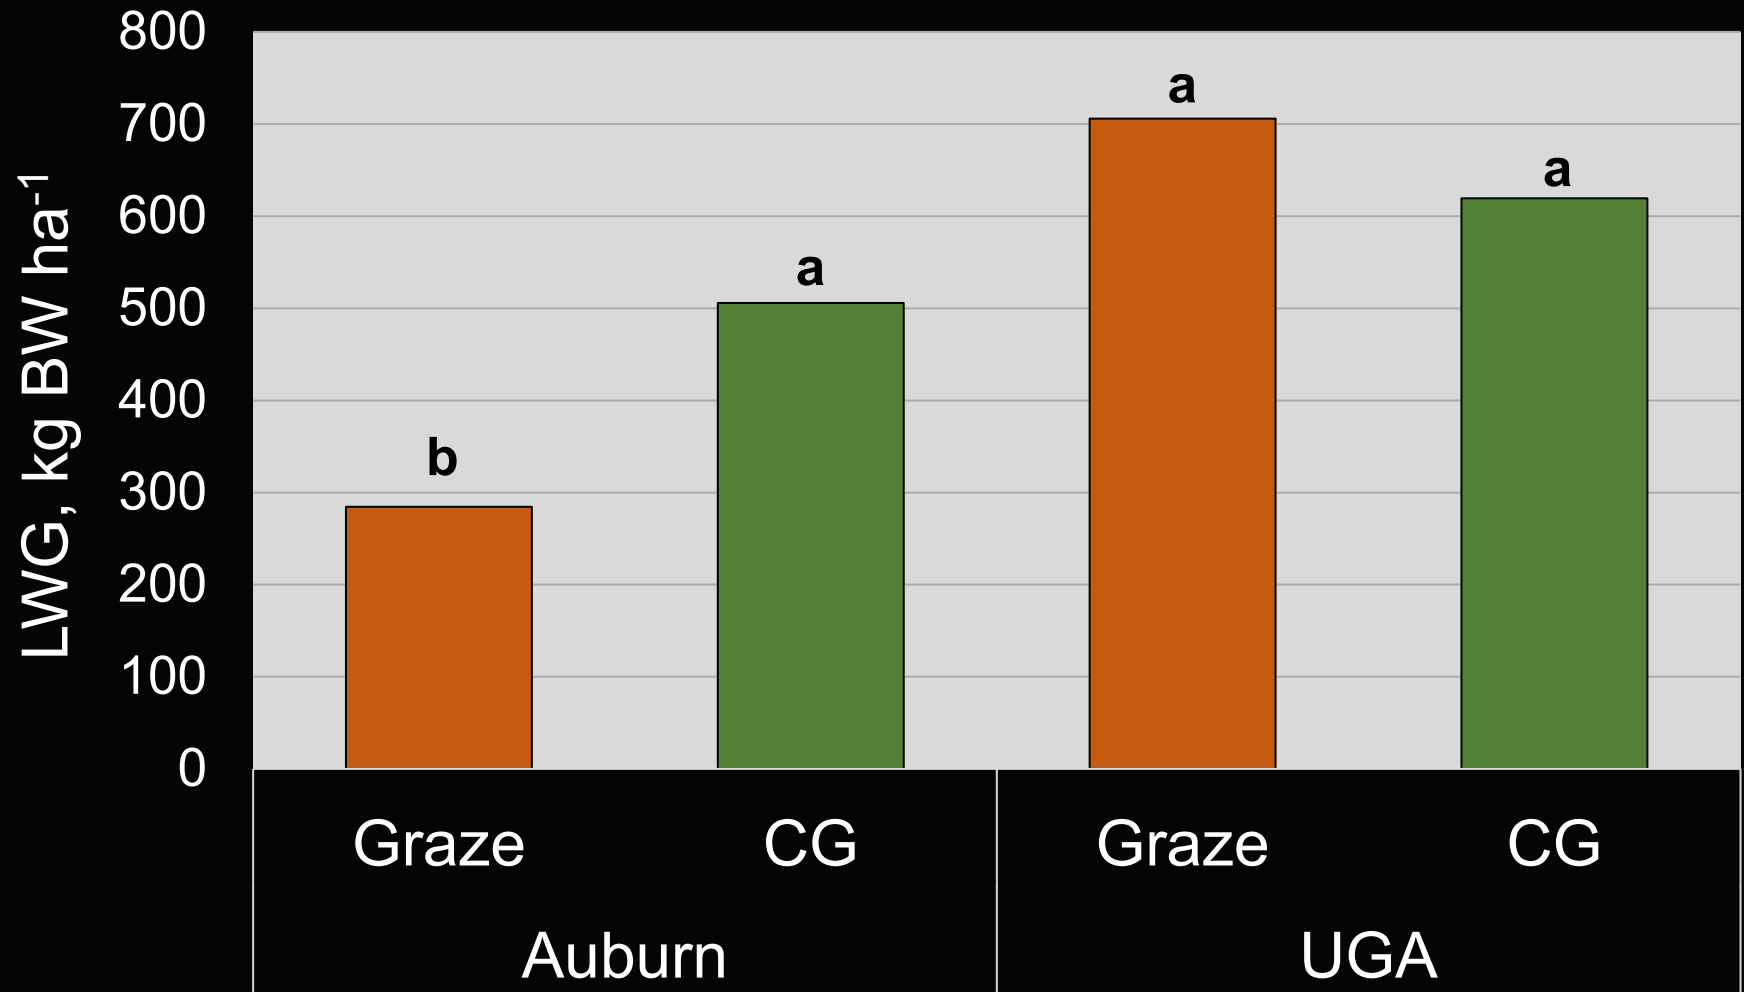

# Results: Average Daily Gain

SEM  $\pm$  0.08 kg hd<sup>-1</sup>

\* Columns without common letters differ  $P \leq 0.05$ .

# Results: Live Weight Gain

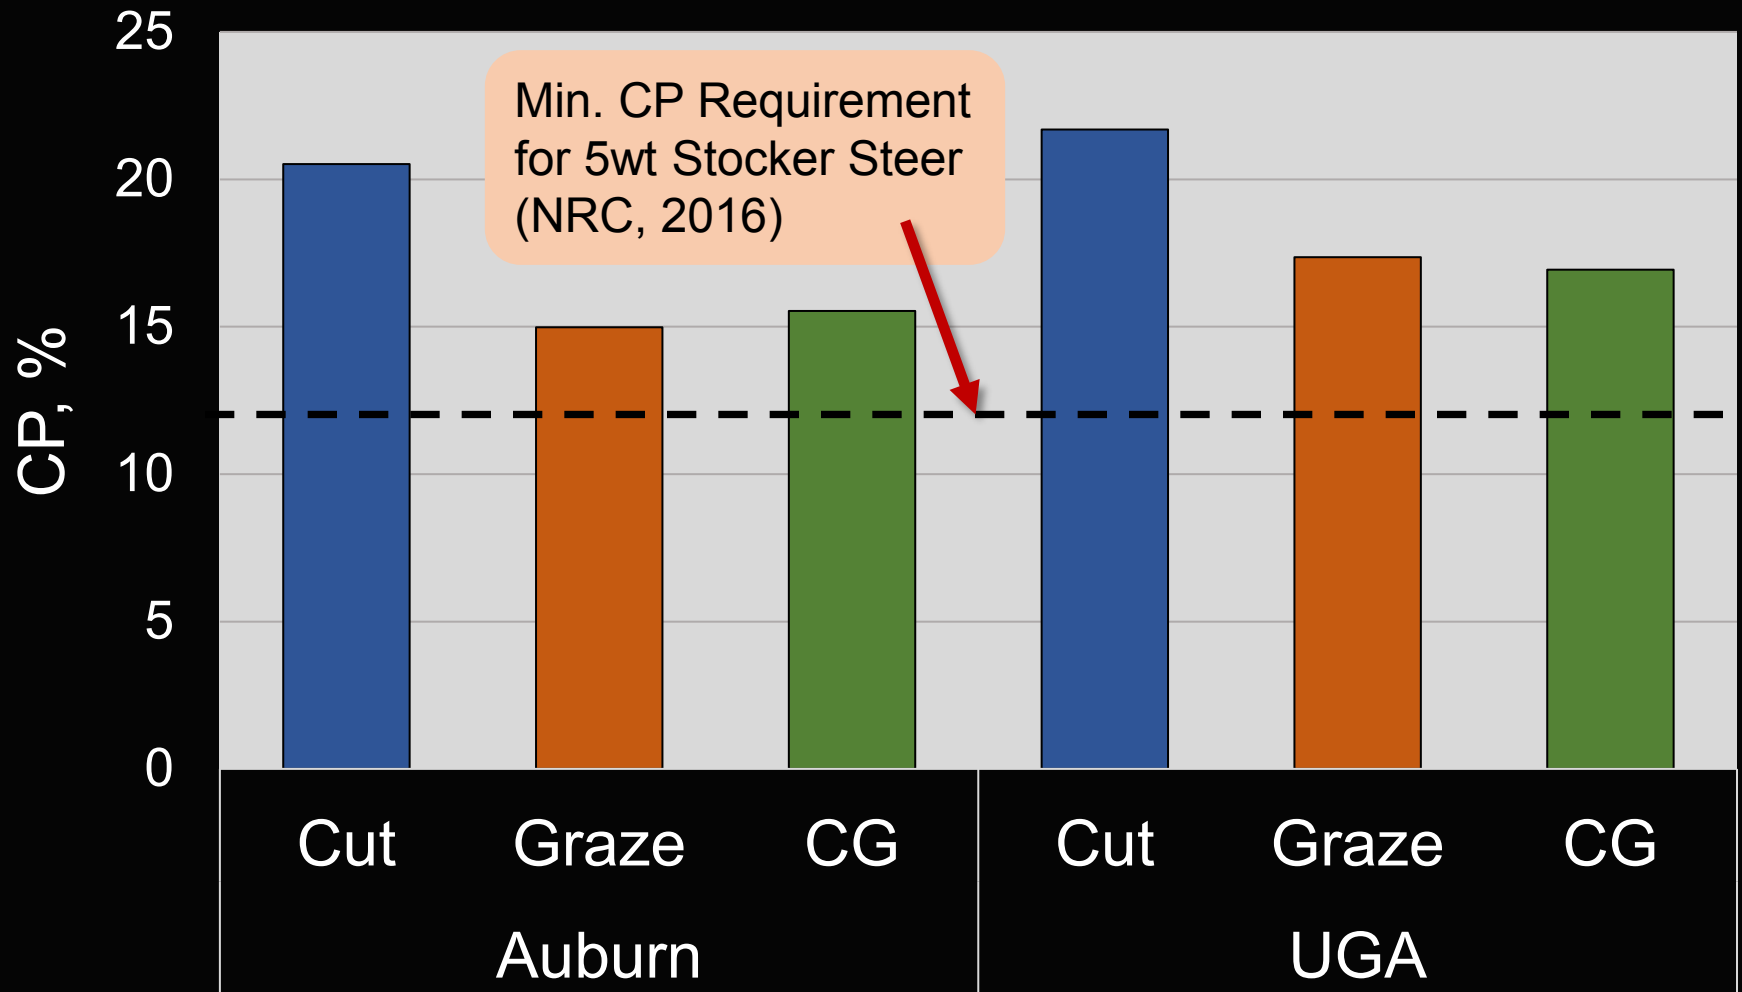

SEM  $\pm$  62.34 kg BW ha<sup>-1</sup>

\* Columns without common letters differ  $P \leq 0.05$ .

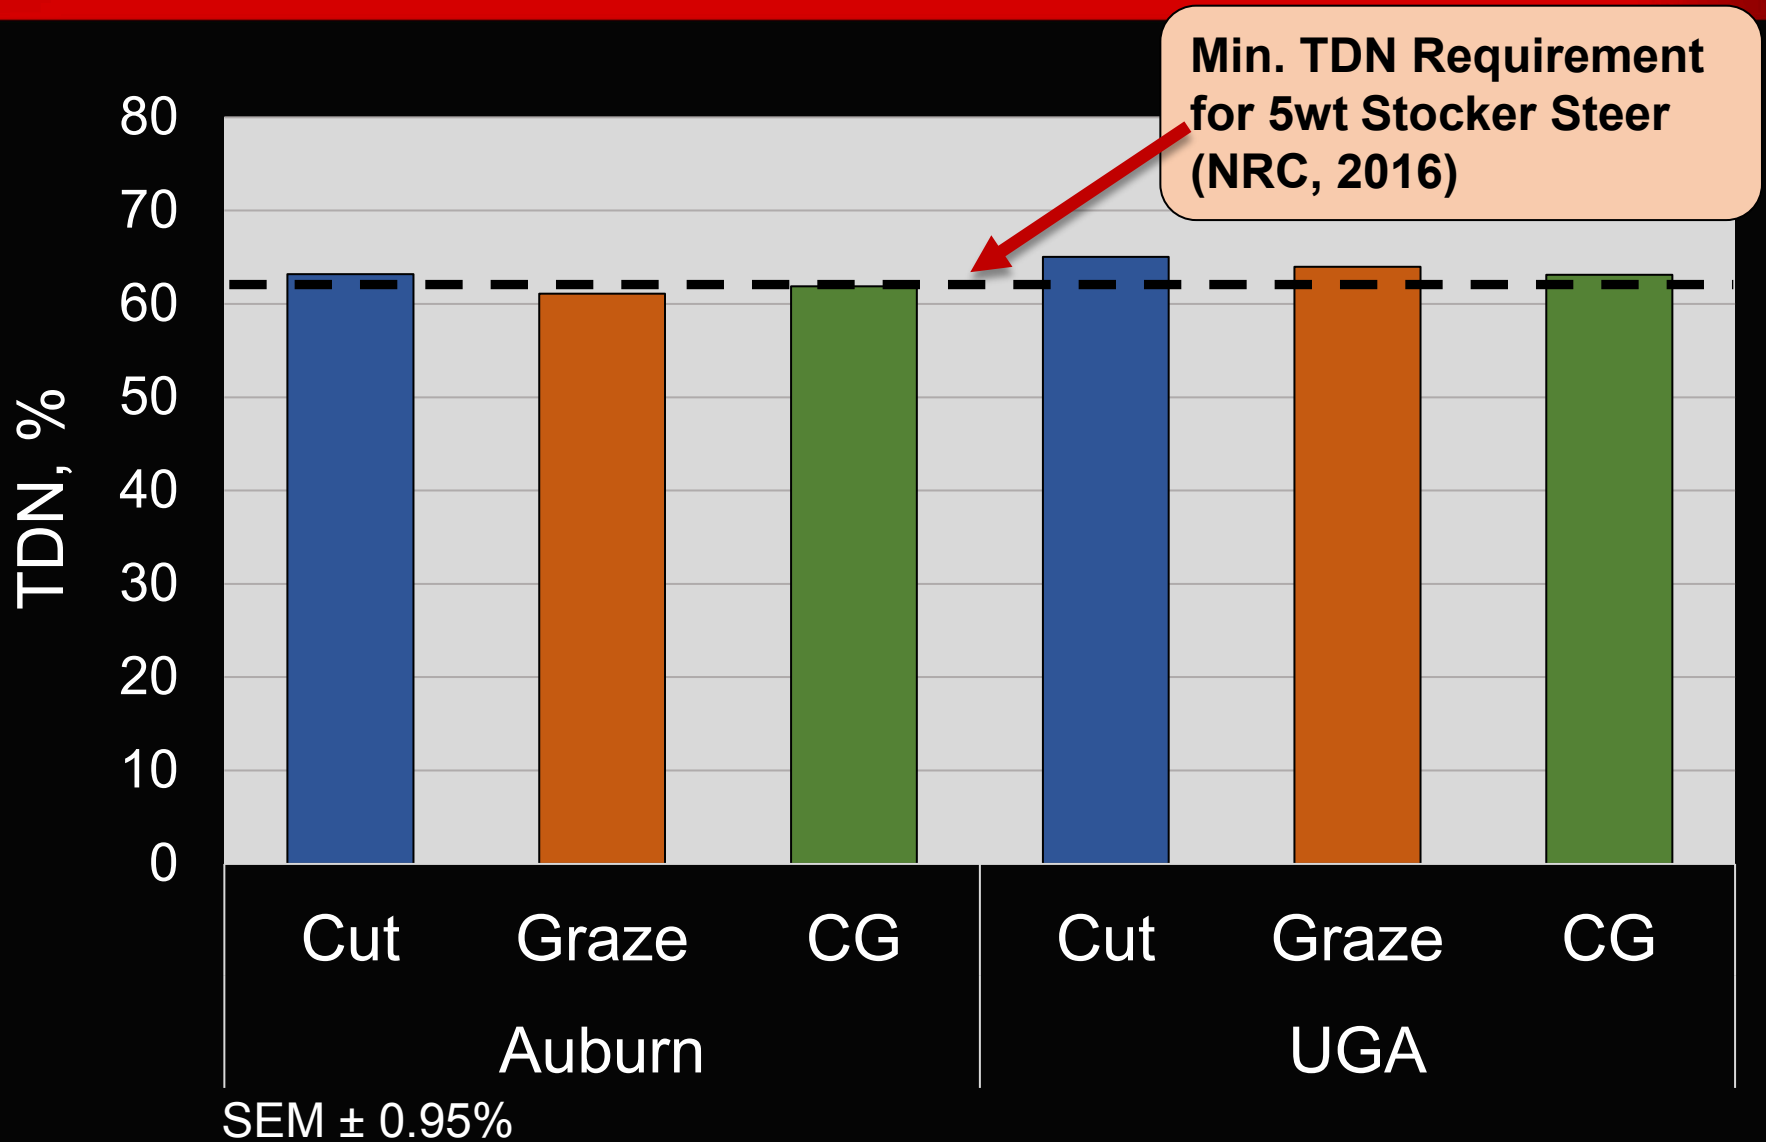

# Results: Crude Protein

SEM  $\pm$  1.54%

\* Columns without common letters differ  $P \leq 0.05$ .

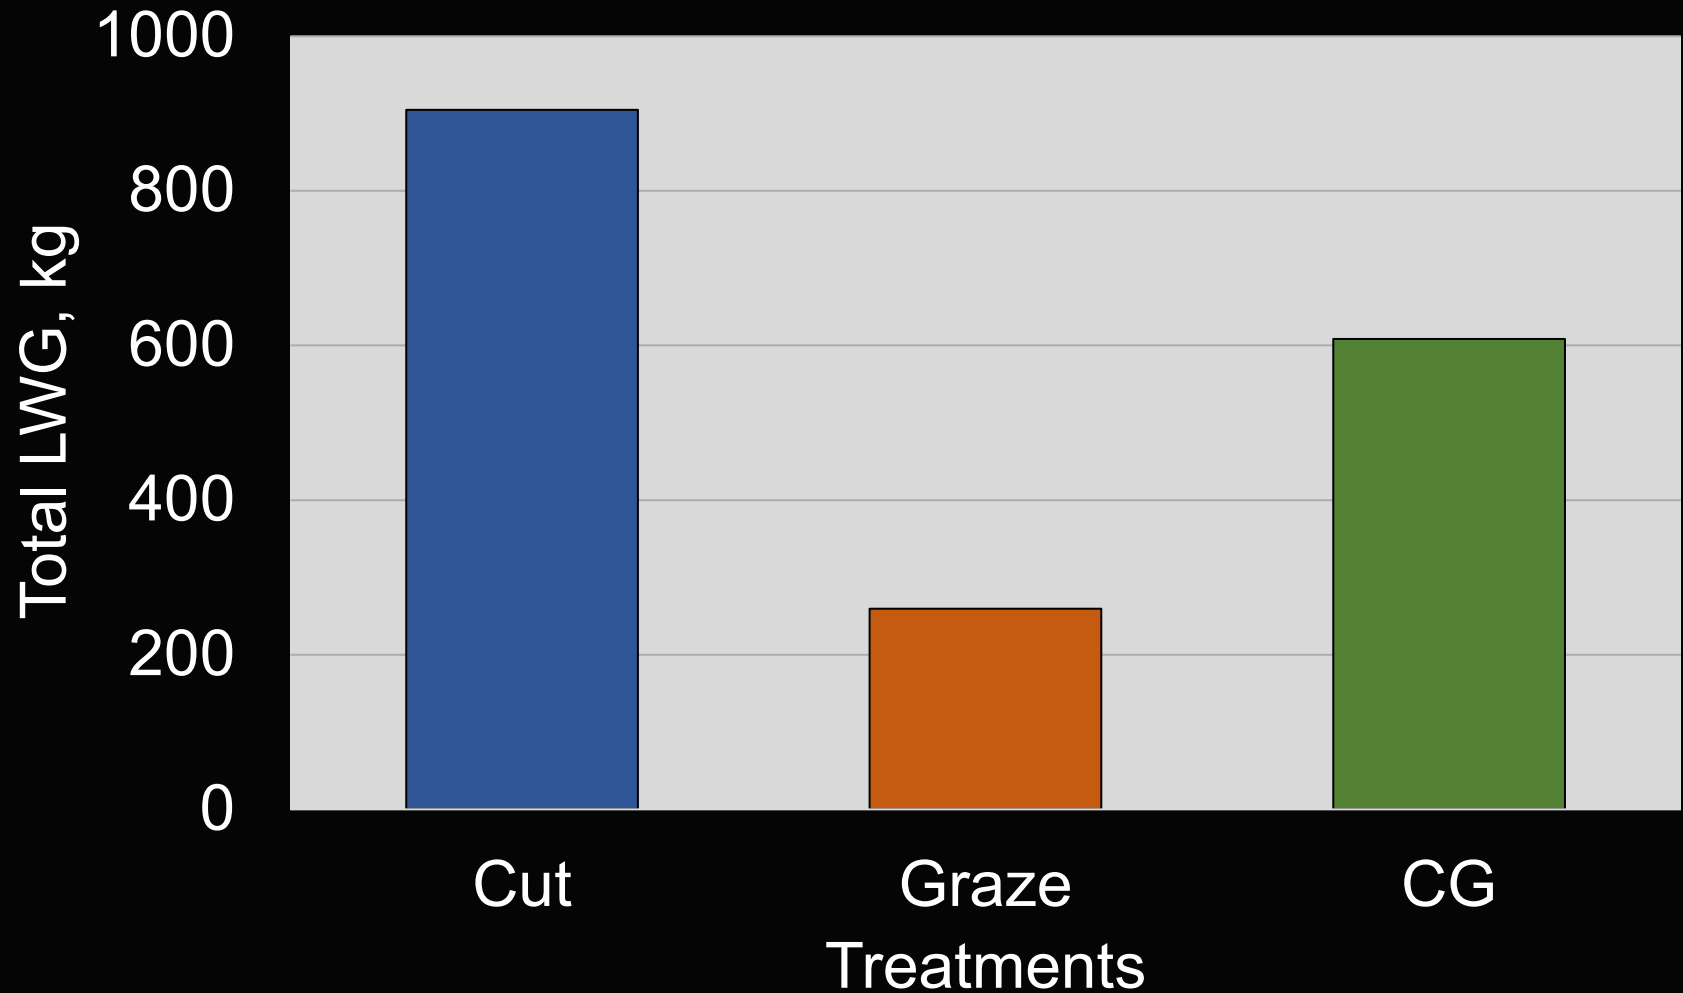

# Results: Total Digestible Nutrients

\* Columns without common letters differ  $P \leq 0.05$ .

# Results: 3-way Comparison

SEM  $\pm$  95.08 kg

\* Columns without common letters differ  $P \leq 0.05$ .

# Results: Total Days of Production

Location	Year 1			Year 2		
	Cut	Graze	CG	Cut	Graze	CG
<b>Auburn</b>	137	98	112	183	133	144
<b>UGA</b>	112	112	112	186	186	188

# Summary

- Herbage Accumulation was greatest in the AU CG treatments
- LWG was lowest in the AU Graze treatments
- CP and TDN met or exceeded the needs of a growing stocker steer

# Conclusion

Strategic management in a dual-use (cut and graze) system is the best management practice for producers in the Southeast looking to use alfalfa-bermudagrass mixtures.
